Package ‘Lahman’

June 9, 2020

Type Package
Title Sean 'Lahman' Baseball Database
Version 8.0-0
Date 2020-06-06
Author Michael Friendly [aut],
Chris Dalzell [cre, aut],
Martin Monkman [aut],
Dennis Murphy [aut],
Vanessa Foot [ctb],
Justeena Zaki-Azat [ctb]
Maintainer Chris Dalzell <cdalzell@gmail.com>
Description Provides the tables from the 'Sean Lahman Baseball Database' as
a set of R data.frames. It uses the data on pitching, hitting and fielding
performance and other tables from 1871 through 2018, as recorded in the 2019
version of the database. Documentation examples show how many baseball
questions can be investigated.
Depends R (>= 3.5.0)
Suggests lattice, ggplot2, googleVis, data.table, vcd, reshape2,
tidyR, knitr, rmarkdown, car
Imports dplyr
Encoding UTF-8
License GPL

Index 66
Description

This database contains pitching, hitting, and fielding statistics for Major League Baseball from 1871 through 2019. It includes data from the two current leagues (American and National), the four other "major" leagues (American Association, Union Association, Players League, and Federal League), and the National Association of 1871-1875.

This database was created by Sean Lahman, who pioneered the effort to make baseball statistics freely available to the general public. What started as a one man effort in 1994 has grown tremendously, and now a team of researchers have collected their efforts to make this the largest and most accurate source for baseball statistics available anywhere.

This database, in the form of an R package offers a variety of interesting challenges and opportunities for data processing and visualization in R.

In the current version, the examples make extensive use of the dplyr package for data manipulation (tabulation, queries, summaries, merging, etc.), reflecting the original relational database design and ggplot2 for graphics.

Details

Package: Lahman
Type: Package
Version: 8.0-0
Date: 2030-03-01
License: GPL version 2 or newer
LazyLoad: yes
LazyData: yes

The main form of this database is a relational database in Microsoft Access format. The design follows these general principles: Each player is assigned a unique code (playerID). All of the information in different tables relating to that player is tagged with his playerID. The playerIDs are linked to names and birthdates in the People table. Similar links exist among other tables via analogous *ID variables.

The database is composed of the following main tables:

- **People**: Player names, dates of birth, death and other biographical info
- **Batting**: batting statistics
- **Pitching**: pitching statistics
- **Fielding**: fielding statistics

A collection of other tables is also provided:

- **Teams**: yearly stats and standings
- **TeamsHalf**: split season data for teams
- **TeamsFranchises**: franchise information
Post-season play:

- **BattingPost**: post-season batting statistics
- **PitchingPost**: post-season pitching statistics
- **FieldingPost**: post-season fielding data
- **SeriesPost**: post-season series information

Awards:

- **AwardsManagers**: awards won by managers
- **AwardsPlayers**: awards won by players
- **AwardsShareManagers**: award voting for manager awards
- **AwardsSharePlayers**: award voting for player awards

Hall of Fame: links to People via hofID

- **HallOfFame**: Hall of Fame voting data

Other tables:

- **AllstarFull**: All-Star games appearances
- **Managers**: managerial statistics
- **FieldingOF**: outfield position data
- **ManagersHalf**: split season data for managers
- **Salaries**: player salary data
- **Appearances**: data on player appearances
- **Schools**: Information on schools players attended
- **CollegePlaying**: Information on schools players attended, by player and year

Variable label tables are provided for some of the tables:

- **battingLabels**, **pitchingLabels**, **fieldingLabels**

**Author(s)**

Michael Friendly, Dennis Murphy, Chris Dalzell, Martin Monkman

Maintainer: Chris Dalzell <cdalzell@gmail.com>

**Source**

**AllstarFull**

**AllstarFull table**

**Description**

All Star appearances by players
Usage

data(AllstarFull)

Format

A data frame with 5375 observations on the following 8 variables.

playerID  Player ID code
yearID    Year
gameNum   Game number (for years in which more than one game was played)
gameID    Game ID code
teamID    Team; a factor
lgID      League; a factor with levels AL NL
GP        Game played (zero if player did not appear in game)
startingPos  If the player started, what position he played

Source

Examples

data(AllstarFull)

# find number of appearances by players in the All Star games
player_appearances <- with(AllstarFull, rev(sort(table(playerID))))

# How many All-Star players, in total?
length(player_appearances)

# density plot of the whole distribution
plot(density(player_appearances), main="Player appearances in All Star Games")
rug(jitter(player_appearances))

# who has played in more than 10 ASGs?
player_appearances[player_appearances > 10]
hist(player_appearances[player_appearances > 10])

# Hank Aaron's All-Star record:
subset(AllstarFull, playerID == "aaronha01")

# Years that Stan Musial played in the ASG:
with(AllstarFull, yearID[playerID == "musiast01"])

# Starting positions he played (NA means did not start)
with(AllstarFull, startingPos[playerID == "musiast01"])
# All-Star rosters from the 1966 ASG
subset(AllstarFull, gameID == "NLS196607120")

# All-Stars from the Washington Nationals
subset(AllstarFull, teamID == "WAS")

# Teams with the fewest All-Stars
rare <- names(which(table(AllstarFull$teamID) < 10))

# Records associated with the 'rare' teams:
# (There are a few teamID typos: can you spot them?)
subset(AllstarFull, teamID %in% rare)

---

### Description

Data on player appearances

### Usage

data(Appearances)

### Format

A data frame with 107357 observations on the following 21 variables.

- **yearID**: Year
- **teamID**: Team; a factor
- **lgID**: League; a factor with levels AA AL FL NL PL UA
- **playerID**: Player ID code
- **G_all**: Total games played
- **GS**: Games started
- **G_batting**: Games in which player batted
- **G_defense**: Games in which player appeared on defense
- **G_p**: Games as pitcher
- **G_c**: Games as catcher
- **G_1b**: Games as firstbaseman
- **G_2b**: Games as secondbaseman
- **G_3b**: Games as thirdbaseman
- **G_ss**: Games as shortstop
- **G_lf**: Games as leftfielder
- **G_cf**: Games as centerfielder
Appearances

G_rf  Games as right fielder
G_of  Games as outfielder
G_dh  Games as designated hitter
G_ph  Games as pinch hitter
G_pr  Games as pinch runner

Details

The Appearances table in the original version has some incorrect variable names. In particular, the 5th column is career_year.

Source

Examples

data(Appearances)
library("dplyr")
library("tidyr")

# Henry Aaron's last two years as a DH in Milwaukee
Appearances %>%
  filter(playerID == "aaronha01" & teamID == "ML4") %>%
  select(yearID:G_batting, G_of:G_ph) # subset variables

# Herb Washington, strictly a pinch runner for Oakland in 1974-5
Appearances %>%
  filter(playerID == "washihe01")

# A true utility player - Jerry Hairston, Jr.
Appearances %>%
  filter(playerID == "hairsje02")

# Appearances for the 1984 Cleveland Indians
Appearances %>%
  filter(teamID == "CLE" & yearID == 1984)

# Pete Rose's primary position each year of his career
Appearances %>%
  filter(playerID == "rosepe01") %>%
  group_by(yearID, teamID) %>%
  gather(pos, G, G_1b:G_rf) %>%
  filter(G == max(G)) %>%
  select(yearID:G_all, pos, G) %>%
  mutate(pos = substring(as.character(pos), 3, 4)) %>%
  arrange(yearID, teamID)

# Most pitcher appearances each year since 1950
AwardsManagers

AwardsManagers table

Description

Award information for managers awards

Usage

data(AwardsManagers)
AwardsPlayers

Format

A data frame with 179 observations on the following 6 variables.

playerID Manager (player) ID code
awardID Name of award won
yearID Year
lgID League; a factor with levels AL NL
tie Award was a tie (Y or N)
notes Notes about the award

Source

Examples

# Post-season managerial awards

# Number of recipients of each award by year
with(AwardsManagers, table(yearID, awardID))

# 1996 award winners
subset(AwardsManagers, yearID == 1996)

# AL winners of the BBWAA managerial award
subset(AwardsManagers, awardID == "BBWAA Manager of the year" &
        lgID == "AL")

# Tony LaRussa's manager of the year awards
subset(AwardsManagers, playerID == "larusto01")

AwardsPlayers AwardsPlayers table

Description

Award information for players awards

Usage

data(AwardsPlayers)
Format

A data frame with 6236 observations on the following 6 variables.

playerID  Player ID code
awardID   Name of award won
yearID    Year
lgID      League; a factor with levels AA AL ML NL
tie       Award was a tie (Y or N)
notes     Notes about the award

Source

Examples

data(AwardsPlayers)
# Which awards have been given and how many?
with(AwardsPlayers, table(awardID))
awardtab <- with(AwardsPlayers, table(awardID))

# Plot the awardtab table as a Cleveland dot plot
library("lattice")
dotplot(awardtab)

# Restrict to MVP awards
mvp <- subset(AwardsPlayers, awardID == "Most Valuable Player")
# Who won in 1994?
mvp[mvp$yearID == 1994L, ]
goldglove <- subset(AwardsPlayers, awardID == "Gold Glove")
# which players won most often?
GGcount <- table(goldglove$playerID)
GGcount[GGcount>10]

# Triple Crown winners
subset(AwardsPlayers, awardID == "Triple Crown")

# Simultaneous Triple Crown and MVP winners
# (compare merged file to TC)
TC <- subset(AwardsPlayers, awardID == "Triple Crown")
MVP <- subset(AwardsPlayers, awardID == "Most Valuable Player")
keepvars <- c("playerID", "yearID", "lgID.x")
merge(TC, MVP, by = c("playerID", "yearID"))[ ,keepvars]
AwardsShareManagers

AwardsShareManagers table

Description

Award voting for managers awards

Usage

data(AwardsShareManagers)

Format

A data frame with 425 observations on the following 7 variables.

- awardID: name of award votes were received for
- yearID: Year
- lgID: League; a factor with levels AL NL
- playerID: Manager (player) ID code
- pointsWon: Number of points received
- pointsMax: Maximum number of points possible
- votesFirst: Number of first place votes

Source

Examples

# Voting for the BBWAA Manager of the Year award by year and league
require("dplyr")

# Sort in decreasing order of points by year and league
AwardsShareManagers %>%
group_by(yearID, lgID) %>%
  arrange(desc(pointsWon))

# Any unanimous winners?
AwardsShareManagers %>%
  filter(pointsWon == pointsMax)

# Manager with highest proportion of possible points
AwardsShareManagers %>%
  mutate(propWon = pointsWon/pointsMax)
  arrange(desc(propWon))
head(., 1)

# Bobby Cox's MOY vote tallies
AwardsShareManagers %>%
  filter(playerID == "coxbo01")

---

**AwardsSharePlayers**  
*AwardsSharePlayers table*

**Description**

Award voting for managers awards

**Usage**

data(AwardsSharePlayers)

**Format**

A data frame with 6879 observations on the following 7 variables.

- **awardID**: name of award votes were received for
- **yearID**: Year
- **lgID**: League; a factor with levels AL ML NL
- **playerID**: Player ID code
- **pointsWon**: Number of points received
- **pointsMax**: Maximum number of points possible
- **votesFirst**: Number of first place votes

**Source**

**Examples**

# Vote tallies for post-season player awards

require("dplyr")

# Which awards are represented in this data frame?
unique(AwardsSharePlayers$awardID)

# Sort the votes for the Cy Young award in decreasing order.
# Until 1967, the award went to the best pitcher
# in both leagues.

cyvotes <- AwardsSharePlayers %>%
  filter(awardID == "Cy Young") %>%
  group_by(yearID, lgID) %>%
  arrange(desc(pointsWon))

# 2012 votes
subset(cyvotes, yearID == 2012)

# top three votegetters each year by league

cya_top3 <- cyvotes %>%
  group_by(yearID, lgID) %>%
  do(head(., 3))
head(cya_top3, 12)

# unanimous Cy Young winners
subset(cyvotes, pointsWon == pointsMax)

## CYA was a major league award until 1967
# Find top five pitchers with most top 3 vote tallies in CYA
# head(with(cya_top3, rev(sort(table(playerID)))), 5)

# Pre-1967
cya_top3 %>%
  filter(yearID <= 1966) %>%
  group_by(playerID) %>%

### Description

Batting table - batting statistics

### Usage

data(Batting)

### Format

A data frame with 107429 observations on the following 22 variables.

- `playerID`  Player ID code
- `yearID`    Year
- `stint`     player's stint (order of appearances within a season)
- `teamID`    Team; a factor
- `lgID`      League; a factor with levels AA AL FL NL PL UA
- `G`        Games: number of games in which a player played
- `AB`       At Bats
- `R`        Runs
- `H`        Hits: times reached base because of a batted, fair ball without error by the defense
- `X2B`      Doubles: hits on which the batter reached second base safely
- `X3B`      Triples: hits on which the batter reached third base safely
- `HR`       Homeruns
- `RBI`      Runs Batted In
- `SB`       Stolen Bases
- `CS`       Caught Stealing
- `BB`       Base on Balls
- `SO`       Strikeouts
Batting

IBB  Intentional walks
HBP  Hit by pitch
SH   Sacrifice hits
SF   Sacrifice flies
GIDP Grounded into double plays

Details

Variables X2B and X3B are named 2B and 3B in the original database

battingLabels

### Variable Labels

These data frames provide descriptive labels for the variables in the Batting, Pitching and Fielding files (and related *Post files). They are useful for plots and other output using Label.
Usage

data(battingLabels)
data(fieldingLabels)
data(pitchingLabels)

Format

Each is data frame with observations on the following 2 variables.

<table>
<thead>
<tr>
<th>variable</th>
<th>variable name</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>variable label</td>
</tr>
</tbody>
</table>

See Also

Label

Examples

data(battingLabels)

require("dplyr")

# find and plot maximum number of homers per year
batHR <- Batting %>%
  filter(!is.na(HR)) %>%
  group_by(yearID) %>%
  summarise(max=max(HR))

with(batHR, {
  plot(yearID, max,
    xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
    cex=0.8)
  lines(lowess(yearID, max), col="blue", lwd=2)
  abline(lm(max ~ yearID), col="red", lwd=2)
})

BattingPost

BattingPost table

Description

Post season batting statistics
**Usage**

```r
data(BattingPost)
```

**Format**

A data frame with 14750 observations on the following 22 variables.

- `yearID` Year
- `round` Level of playoffs
- `playerID` Player ID code
- `teamID` Team
- `lgID` League; a factor with levels AA AL NL
- `G` Games
- `AB` At Bats
- `R` Runs
- `H` Hits
- `X2B` Doubles
- `X3B` Triples
- `HR` Homeruns
- `RBI` Runs Batted In
- `SB` Stolen Bases
- `CS` Caught stealing
- `BB` Base on Balls
- `SO` Strikeouts
- `IBB` Intentional walks
- `HBP` Hit by pitch
- `SH` Sacrifices
- `SF` Sacrifice flies
- `GIDP` Grounded into double plays

**Details**

Variables X2B and X3B are named 2B and 3B in the original database.

**Source**

Examples

# Post-season batting data
# Requires care since intra-league playoffs have evolved since 1969
# Simplest case: World Series

require("dplyr")

# Create a sub-data frame for modern World Series play
ws <- BattingPost %>%
  filter(round == "WS" & yearID >= 1903) %>%
  mutate(BA = 0 + (AB > 0) * round(H/AB, 3),
         TB = H + 2 * X2B + 2 * X3B + 3 * HR,
         SA = 0 + (AB > 0) * round(TB/AB, 3),
         PA = AB + BB + IBB + HBP + SH + SF,
         OB = H + BB + IBB + HBP,
         OBP = 0 + (AB > 0) * round(OB/PA, 3) )

# Players with most appearances in the WS:
ws %>% group_by(playerID) %>%
  summarise(appearances = n()) %>%
  arrange(desc(appearances)) %>%
  head(., 10)

# Non-Yankees with most WS appearances
ws %>% filter(teamID != "NYA") %>%
  group_by(playerID) %>%
  summarise(appearances = n()) %>%
  arrange(desc(appearances)) %>%
  head(., 10)

# Top ten single WS batting averages ( >= 10 AB )
ws %>% filter(AB > 10) %>%
  arrange(desc(BA)) %>%
  head(., 10)

# Top ten slugging averages in a single WS
ws %>% filter(AB > 10) %>%
  arrange(desc(SA)) %>%
  head(., 10)

# Hitting stats for the 1946 St. Louis Cardinals, ordered by BA
ws %>%
  filter(teamID == "SLN" & yearID == 1946) %>%
  arrange(desc(BA))

# Babe Ruth's WS profile
ws %>%
  filter(playerID == "ruthba01") %>%
  arrange(yearID)
battingStats

Calculate additional batting statistics

Description

The Batting does not contain batting statistics derived from those present in the data.frame. This function calculates batting average (BA), plate appearances (PA), total bases (TB), slugging percentage (SlugPct), on-base percentage (OBP), on-base percentage + slugging (OPS), and batting average on balls in play (BABIP) for each record in a Batting-like data.frame.

Usage

battingStats(data = Lahman::Batting,
              idvars = c("playerID", "yearID", "stint", "teamID", "lgID"),
              cbind = TRUE)

Arguments

data input data, typically Batting
idvars ID variables to include in the output data.frame
cbind If TRUE, the calculated statistics are appended to the input data as additional columns

Details

Standard calculations, e.g., BA <-H/AB are problematic because of the presence of NAs and zeros. This function tries to deal with those problems.

Value

A data.frame with all the observations in data. If cbind==FALSE, only the idvars and the calculated variables are returned.

Author(s)

Michael Friendly, Dennis Murphy

Examples

bstats <- battingStats()
str(bstats)
bstats <- battingStats(cbind=FALSE)
str(bstats)
CollegePlaying  

**Description**

Information on schools players attended, by player

**Usage**

```r
data(CollegePlaying)
```

**Format**

A data frame with 17350 observations on the following 3 variables.

- `playerID`  Player ID code
- `schoolID`  school ID code
- `yearID`  Year player attended school

**Details**

This data set reflects a change in the Lahman schema for the 2015 version. The old `SchoolsPlayers` table was replaced with this new table called `CollegePlaying`.

According to the documentation, this change reflects advances in the compilation of this data, largely led by Ted Turocy. The old table reported college attendance for major league players by listing a start date and end date. The new version has a separate record for each year that a player attended. This allows us to better account for players who attended multiple colleges or skipped a season, as well as to identify teammates.

**Source**

**Examples**

```r
data(CollegePlaying)
head(CollegePlaying)

## Q: What are the top universities for producing MLB players?
SPcount <- table(CollegePlaying$schoolID)
SPcount[SPcount>50]

library("lattice")
dotplot(SPCount[SPCount>50])
dotplot(sort(SPCount[SPCount>50]))

## Q: How many schools are represented in this dataset?
length(table(CollegePlaying$schoolID))

# Histogram of the number of players from each school who played in MLB:
with(CollegePlaying,
    hist(table(schoolID), xlab = "Number of players",
         main = ""))

<table>
<thead>
<tr>

Description

Fielding table

Usage

data(Fielding)

Format

A data frame with 143046 observations on the following 18 variables.

playerID Player ID code
yearID Year
stint player's stint (order of appearances within a season)
teamID Team; a factor
lgID League; a factor with levels AA AL FL NL PL UA
POS Position
G Games
GS Games Started
InnOuts Time played in the field expressed as outs
PO Putouts
A Assists
E Errors
DP Double Plays
PB Passed Balls (by catchers)
WP Wild Pitches (by catchers)
SB Opponent Stolen Bases (by catchers)
CS Opponents Caught Stealing (by catchers)
ZR Zone Rating
Source

Examples

data(Fielding)
# Basic fielding data
require("dplyr")

# Roberto Clemente's fielding profile
# pitching and catching related data removed
# subset( Fielding, playerID == "clemero01")[, 1:13]
Fielding %>%
  filter(playerID == "clemero01") %>%
  select(1:13)

# Yadier Molina's fielding profile
# PB, WP, SP and CS apply to catchers
Fielding %>%
  subset(playerID == "molinya01") %>%
  select(-WP, -ZR)

# Pedro Martinez's fielding profile
Fielding %>% subset(playerID == "martipe02")

# Table of games played by Pete Rose at different positions
with(subset( Fielding, playerID == "rosepe01"), xtabs(G ~ POS))

# Career total G/PO/A/E/DP for Luis Aparicio
Fielding %>%
  filter(playerID == "aparilu01") %>%
  select(G, PO, A, E, DP) %>%
  summarise_each(funs(sum))

# Top ten 2B/SS in turning DPs
Fielding %>%
  subset(POS %in% c("2B", "SS")) %>%
  group_by(playerID) %>%
  summarise(TDP = sum(DP, na.rm = TRUE)) %>%
  arrange(desc(TDP)) %>%
  head(., 10)

# League average fielding statistics, 1961-present
Fielding %>%
  filter(yearID >= 1961 & POS != "DH") %>%
  select(yearID, lgID, POS, InnOuts, PO, A, E) %>%
  group_by(yearID, lgID) %>%
  summarise_at(vars(InnOuts, PO, A, E), funs(sum), na.rm = TRUE) %>%
mutate(fpct = round((PO + A)/(PO + A + E), 3),
     OPE = round(InnOuts/E, 3))

FieldingOF table

**Description**

Outfield position data: information about positions played in the outfield

**Usage**

data(FieldingOF)

**Format**

A data frame with 12028 observations on the following 6 variables.

- `playerID` Player ID code
- `yearID` Year
- `stint` player’s stint (order of appearances within a season)
- `Glf` Games played in left field
- `Gcf` Games played in center field
- `Grf` Games played in right field

**Source**

**Examples**

```r
require("dplyr")
require("tidyr")

## Data set only goes through 1955
## Can get a more complete record from the Fielding data frame
## or from the Appearances data (see below)

## Output directly from the FieldingOF data

## Barry Bonds (no records: post-1955 player)
FieldingOF %>%
  filter(playerID == "bondsba01")

## Willie Mays (first few years)
```
FieldingOF %>%
  filter(playerID == "maysui01")

## Ty Cobb (complete)
FieldingOF %>%
  filter(playerID == "cobbty01")

## One way to get OF game information from the Fielding data
## Note: OF games != sum(LF, CF, RF) because players can switch
## OF positions within a game. Players can also switch from
## other positions to outfield during a game. OF represents
## the number of games a player started in the outfield.
Fielding %>%
  select(playerID, yearID, stint, POS, G) %>%
  filter(POS %in% c("LF", "CF", "RF", "OF")) %>%
  tidyr::spread(POS, G, fill = 0) %>%
  filter(playerID == "trumbma01")

## Another way is through the Appearances data (no stint).
## Provides a somewhat nicer table than the above.
## Mark Trumbo (active player)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "trumbma01")

## A slightly better format, perhaps
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  rename(LF = G_lf, CF = G_cf, RF = G_rf, OF = G_of) %>%
  filter(playerID == "trumbma01")

## Willie Mays (1951-1973)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "maysui01")

## Joe DiMaggio (1936-1951)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "dimagjo01")

---

**FieldingOFsplit**

FieldingPost data

### Description
Post season fielding data

### Usage
data(FieldingPost)

### Format
A data frame with 13938 observations on the following 17 variables.

- `playerID`: Player ID code
- `yearID`: Year
- `teamID`: Team; a factor
- `lgID`: League; a factor with levels AL NL
- `round`: Level of playoffs
- `POS`: Position
- `G`: Games
- `GS`: Games Started
- `InnOuts`: Time played in the field expressed as outs
- `PO`: Putouts
- `A`: Assists
- `E`: Errors
- `DP`: Double Plays
- `TP`: Triple Plays
- `PB`: Passed Balls
- `SB`: Stolen Bases allowed (by catcher)
- `CS`: Caught Stealing (by catcher)
### Examples

```r
require("dplyr")

## World Series fielding record for Yogi Berra
FieldingPost %>%
  filter(playerID == "berrayo01" & round == "WS")

## Yogi's career efficiency in throwing out base stealers
## in his WS appearances and CS as a percentage of his
## overall assists
FieldingPost %>%
  filter(playerID == "berrayo01" & round == "WS" & POS == "C") %>%
  summarise(cs_pct = round(100 * sum(CS)/sum(SB + CS), 2),
            cs_assists = round(100 * sum(CS)/sum(A), 2))

## Innings per error for several selected shortstops in the WS
FieldingPost %>%
  filter(playerID %in% c("belanma01", "jeterde01", "campabe01",
                          "conceda01", "bowala01"), round == "WS") %>%
  group_by(playerID) %>%
  summarise(G = sum(G),
            InnOuts = sum(InnOuts),
            Eper9 = round(27 * sum(E)/sum(InnOuts), 3))

## Top 10 center fielders in innings played in the WS
FieldingPost %>%
  filter(POS == "CF" & round == "WS") %>%
  group_by(playerID) %>%
  summarise(inn_total = sum(InnOuts)) %>%
  arrange(desc(inn_total)) %>%
  head(., 10)

## Most total chances by position
FieldingPost %>%
  filter(round == "WS" & !(POS %in% c("DH", "OF", "P"))) %>%
  group_by(POS, playerID) %>%
  summarise(TC = sum(PO + A + E)) %>%
  arrange(desc(TC)) %>%
  do(head(., 1))  # provides top player by position
```

Source

Description

Hall of Fame table. This is composed of the voting results for all candidates nominated for the Baseball Hall of Fame.

Usage

data(HallOfFame)

Format

A data frame with 4191 observations on the following 9 variables.

- `playerID`: Player ID code
- `yearID`: Year of ballot
- `votedBy`: Method by which player was voted upon. See Details
- `ballots`: Total ballots cast in that year
- `needed`: Number of votes needed for selection in that year
- `votes`: Total votes received
- `inducted`: Whether player was inducted by that vote or not (Y or N)
- `category`: Category of candidate; a factor with levels Manager Pioneer/Executive Player Umpire
- `needed_note`: Explanation of qualifiers for special elections

Details

This table links to the `People` table via the `playerID`.

- `votedBy`: Most Hall of Fame inductees have been elected by the Baseball Writers Association of America (BBWAA). Rules for election are described in [http://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process](http://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process).

Source

Examples

```r
## Some examples for Hall of Fame induction data

require("dplyr")
require("ggplot2")

# Simple queries

# What are the different types of HOF voters?
table(HallOfFame$votedBy)

# What was the first year of Hall of Fame elections?
```
HallOfFame

sort(unique(HallOfFame$yearID))[1]
# Who comprised the original class?
subset(HallOfFame, yearID == 1936 & inducted == "Y")

# Result of a player's last year on the BBWAA ballot
# Restrict to players voted by BBWAA:
HOFplayers <- subset(HallOfFame,
votedBy == "BBWAA" & category == "Player")

# Number of years as HOF candidate, last pct vote, etc.
# for a given player
playerOutcomes <- HallOfFame %>%
  filter(votedBy == "BBWAA" & category == "Player") %>%
  group_by(playerID) %>%
  mutate(nyears = length(ballots)) %>%
  arrange(yearID) %>%
  do(tail(., 1)) %>%
  mutate(lastPct = 100 * round(votes/ballots, 3)) %>%
  select(playerID, nyears, inducted, lastPct, yearID) %>%
  rename(lastYear = yearID)

############################################################
# How many voting years until election?
inducted <- subset(playerOutcomes, inducted == "Y")
table(inducted$nyears)
# Bar chart of years to induction for inductees
barplot(table(inducted$nyears),
main="Number of voting years until election",
ylab="Number of players", xlab="Years")
box()

# What is the form of this distribution?
require("vcd")
goodfit(inducted$nyears)
plot(goodfit(inducted$nyears), xlab="Number of years",
main="Poissonness plot of number of years voting until election")
Ord.plot(table(inducted$nyears), xlab="Number of years")

# First ballot inductees sorted by vote percentage:
playerOutcomes %>%
  filter(nyears == 1L & inducted == "Y") %>%
  arrange(desc(lastPct))

# Who took at least ten years on the ballot before induction?
playerOutcomes %>%
  filter(nyears >= 10L & inducted == "Y")

############################################################

## Plots of voting percentages over time for the borderline HOF candidates, according to the BBWAA:

# Identify players on the BBWAA ballot for at least 10 years
# Returns a character vector of playerIDs
longTimers <- as.character(unlist(subset(playerOutcomes, nyears >= 10, select = "playerID")))

# Extract their information from the HallOfFame data
HOFlt <- HallOfFame %>%
  filter(playerID %in% longTimers & votedBy == "BBWAA") %>%
  group_by(playerID) %>%
  mutate(elected = ifelse(any(inducted == "Y"), "Elected", "Not elected"),
         pct = 100 * round(votes/ballots, 3))

# Plot the voting profiles:
ggplot(HOFlt, aes(x = yearID, y = pct, group = playerID)) +
ggtitle("Profiles of BBWAA voting percentage, long-time HOF candidates") +
geom_line() +
geom_hline(yintercept = 75, colour = "red") +
labs(x = "Year", y = "Percentage of votes") +
facet_wrap(~ elected, ncol = 1)

## Eventual inductees tend to have increasing support over time.
## Fit simple linear regression models to each player's voting percentage profile and extract the slopes. Then compare the distributions of the slopes in each group.

# data frame for playerID and induction status among long term candidates
HOFstatus <- HOFlt %>%
  group_by(playerID) %>%
  select(playerID, elected, inducted) %>%
  do(tail(., 1))

# data frame of regression slopes, which represent average increase in percentage support by BBWAA members over a player's candidacy.
HOFslope <- HOFlt %>%
  group_by(playerID) %>%
  do(mod = lm(pct ~ yearID, data = .)) %>%
  do(data.frame(slope = coef(.$mod)[2]))

## Boxplots of regression slopes by induction group
ggplot(data.frame(HOFstatus, HOFslope),
       aes(x = elected, y = slope)) +
geom_boxplot(width = 0.5) +
geom_point(position = position_jitter(width = 0.2))

# Note 1: Only two players whose maximum voting percentage was over 60% were not eventually inducted
# into the HOF: Gil Hodges and Jack Morris.
# Red Ruffing was elected in a 1967 runoff election while
# the others have been voted in by the Veterans Committee.

# Note 2: Of the players whose slope was >= 2.5 among
# non-inductees, only Jack Morris has not (yet) been
# subsequently inducted into the HOF; however, his last year of
# eligibility was 2014 so he could be inducted by a future
# Veterans Committee.

**HomeGames**

<table>
<thead>
<tr>
<th>HomeGames table</th>
</tr>
</thead>
</table>

**Description**

Data mapping teams to the stadiums they played regular season games in as the home team.

**Usage**

data(HomeGames)

**Format**

A data frame with 3108 observations on the following 9 variables.

- **year.key** Year
- **league.key** League; a factor with levels AA AL FL NL PL UA
- **team.key** Team; a factor
- **park.key** Unique identifier for each ballpark
- **span.first** First date the park began acting as home field for the team
- **span.last** Last date the park began acting as home field for the team
- **games** Total games in this time span
- **openings** Total opening in this time span
- **attendance** Total attendance in this time span

**Source**

Examples

data(HomeGames)
library(dplyr)

# How many parks has every team played in as the home team for even a single game?
HomeGames %>%
count(team.key) %>%
arrange(team.key)

# What parks have the Toronto Blue Jays played in as the home team?
HomeGames %>%
filter(team.key == "TOR") %>%
arrange(span.last)

# What parks have the Boston Red Sox played in as the home team?
HomeGames %>%
filter(team.key == "BOS") %>%
arrange(span.last)

# What is the Toronto Blue Jays annual total home attendance by year?
HomeGames %>%
filter(team.key == "TOR") %>%
group_by(year.key) %>%
summarize(total.attendance = sum(attendance)) %>%
arrange(year.key)

Label

Extract the Label for a Variable

Description

Extracts the label for a variable from one or more of the *Labels files. This is useful for plots and other displays because the variable names are often cryptically short.

Usage

Label(var, labels = rbind(Lahman::battingLabels,
                           Lahman::pitchingLabels,
                           Lahman::fieldingLabels))

Arguments

var name of a variable
labels label table(s) to search, a 2-column dataframe containing variable names and labels.

Value

Returns the variable label, or var if no label is found
**LahmanData**

**Author(s)**

Michael Friendly

**See Also**

battingLabels, pitchingLabels, fieldingLabels

**Examples**

```r
require("dplyr")
# find and plot maximum number of homers per year
batHR <- Batting %>%
  filter(!is.na(HR)) %>%
  group_by(yearID) %>%
  summarise(max = max(HR))

with(batHR, {
  plot(yearID, max,
       xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
       cex=0.8)
  lines(lowess(yearID, max), col="blue", lwd=2)
  abline(lm(max ~ yearID), col="red", lwd=2)
})
```

**Description**

This dataset gives a concise description of the data files in the Lahman package. It may be useful for computing on the various files.

**Usage**

```r
data(LahmanData)
```

**Format**

A data frame with 24 observations on the following 5 variables.

- **file** name of dataset
- **class** class of dataset
- **nobs** number of observations
- **nvar** number of variables
- **title** dataset title
Details

This dataset is generated using vcdExtra::datasets(package="Lahman") with some post-processing.

Examples

data(LahmanData)

# find ID variables in the datasets
IDvars <- lapply(LahmanData[, "file"], function(x) grep('.*ID$', colnames(get(x)), value=TRUE))
names(IDvars) <- LahmanData[, "file"]

# vector of unique ID variables
unique(unlist(IDvars))

# which datasets have playerID?
names(which(sapply(IDvars, function(x) "playerID" %in% x)))

########################################################################
# Visualize relations among datasets via an MDS
########################################################################
# jaccard distance between two sets; assure positivity
jaccard <- function(A, B) {
  max(1 - length(intersect(A,B)) / length(union(A,B)), .00001)
}

distmat <- function(vars, FUN=jaccard) {
  nv <- length(vars)
  d <- matrix(0, nv, nv, dimnames=list(names(vars), names(vars)))
  for(i in 1:nv) {
    for (j in 1:nv) {
      if (i != j) d[i,j] <- FUN(vars[[i]], vars[[j]])
    }
  }
  d
}

# do an MDS on distances
distID <- distmat(IDvars)
config <- cmdscale(distID)

pos=rep(1:4, length=nrow(config))
plot(config[,1], config[,2], xlab = "", ylab = "", asp = 1, axes=FALSE,
     main="MDS of ID variable distances of Lahman tables")
abline(h=0, v=0, col="gray80")
text(config[,1], config[,2], rownames(config), cex = 0.75, pos=pos, xpd=NA)
Managers

Description
Managers table: information about individual team managers, teams they managed and some basic statistics for those teams in each year.

Usage
data(Managers)

Format
A data frame with 3536 observations on the following 10 variables.

- playerId: Manager (player) ID code
- yearID: Year
- teamID: Team; a factor
- lgID: League; a factor with levels AA AL FL NL PL UA
- inseason: Managerial order. Zero if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.)
- G: Games managed
- W: Wins
- L: Losses
- rank: Team’s final position in standings that year
- plyrMgr: Player Manager (denoted by ‘Y’); a factor with levels N Y

Source

Examples

```r
library("dplyr")
mgrSumm <- Managers %>%
  group_by(playerID) %>%
  summarise(nyear = length(unique(yearID)),
            yearBegin = min(yearID),
            yearEnd = max(yearID),
            nTeams = length(unique(teamID)),
            nfirst = sum(rank == 1L),
            W = sum(W),
            L = sum(L),
            WinPct = round(W/(W + L), 3))
```
Managers

```r
MgrInfo <- People %>%
  filter(!is.na(playerID)) %>%
  select(playerID, nameLast, nameFirst)

# Merge names into the table
mgrTotals <- right_join(MgrInfo, mgrSumm, by = "playerID")

# add total games managed
mgrTotals <- mgrTotals %>%
  mutate(games = W + L)

# Some basic queries

# Top 20 managers in terms of years of service:
mgrTotals %>%
  arrange(desc(nyear)) %>%
  head(., 20)

# Top 20 winningest managers (500 games minimum)
mgrTotals %>%
  filter((W + L) >= 500) %>%
  arrange(desc(WinPct)) %>%
  head(., 20)

# Most of these are 19th century managers.
# How about the modern era?
mgrTotals %>%
  filter(yearBegin >= 1901 & (W + L) >= 500) %>%
  arrange(desc(WinPct)) %>%
  head(., 20)

# Top 10 managers in terms of percentage of titles
# (league or divisional) - should bias toward managers
# post-1970 since more first place finishes are available
mgrTotals %>%
  filter(yearBegin >= 1901 & (W + L) >= 500) %>%
  arrange(desc(round(nfirst/nyear, 3))) %>%
  head(., 10)

# How about pre-1969?
mgrTotals %>%
  filter(yearBegin >= 1901 & yearEnd <= 1969 &
         (W + L) >= 500) %>%
  arrange(desc(round(nfirst/nyear, 3))) %>%
  head(., 10)

## Tony LaRussa's managerial record by team
Managers %>%
  filter(playerID == "larusto01") %>%
  group_by(teamID) %>%
  summarise(nyear = length(unique(yearID)),
```
Managers

```r
yearBegin = min(yearID),
yearEnd = max(yearID),

  arrange(desc(W + L))
```

# Connie Mack's advantage: he owned the Philadelphia A's :)

# Table of Tony LaRussa's team finishes (rank order):
```r
Managers %>%
  filter(playerID == "larusto01") %>%
  count(rank)
```

# Scatterplot of winning percentage vs. number of games managed (min 100)
```r
ggplot(subset(mgrTotals, yearBegin >= 1900 & games >= 100),
  aes(x = games, y = WinPct)) +
  geom_point() + geom_smooth() +
  labs(x = "Number of games managed")
```

# Division titles
```r
# Plot of number of first place finishes by managers who
# started in the divisional era (>= 1969) with
# at least 8 years of experience
mgrTotals %>%
  filter(yearBegin >= 1969 & nyear >= 8) %>%
ggplot(. , aes(x = nyear, y = nfirst)) +
  geom_point(position = position_jitter(width = 0.2)) +
```
ManagersHalf

```r
labs(x = "Number of years",
     y = "Number of divisional titles") +
geom_smooth()

# Change response to proportion of titles relative
# to years managed
mgrTotals %>%
  filter(yearBegin >= 1969 & nyear >= 8) %>%
  ggplot(. , aes(x = nyear, y = round(nfirst/nyear, 3))) +
  geom_point(position = position_jitter(width = 0.2)) +
  labs(x = "Number of years",
       y = "Proportion of divisional titles") +
  geom_smooth()
```

ManagersHalf table

Description

Split season data for managers

Usage

```r
data(ManagersHalf)
```

Format

A data frame with 93 observations on the following 10 variables.

playerID  Manager (player) ID code
yearID    Year
teamID    Team; a factor
lgID      League; a factor with levels AL NL
inseason  Managerial order. One if the individual managed the team the entire year. Otherwise
denotes where the manager appeared in the managerial order (1 for first manager, 2 for second,
etc.). A factor with levels 1 2 3 4 5
half      First or second half of season
G         Games managed
W         Wins
L         Losses
rank      Team’s position in standings for the half
Source

Examples
library("dplyr")
library("reshape2")

# Only have data for 1892 and 1981

# League rank by half for 1981 teams with the same
# manager in both halves who were hired in-season
ManagersHalf %>%
  filter(yearID >= 1901) %>%
  group_by(teamID, yearID) %>%
  filter(all(playerID == playerID[1])) %>% # same manager in both halves
  mutate(winPct = round(W/G, 3)) %>% #
  reshape2::dcast(playerID + yearID + teamID + lgID ~ half,
      value.var = "rank") %>%
  rename(rank1 = `1`, rank2 = `2`)

Master

Description

**Deprecation Notice**: The Master table is now the People table in the Lahman dataset. Master is now a copy of People and is being retained for backward compatibility. Please change your code to use the People table.

Master table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the Batting, Pitching, and other files where players are identified only by playerID.

Usage
data(Master)

Format
A data frame with 19878 observations on the following 26 variables.

playerID A unique code assigned to each player. The playerID links the data in this file with records on players in the other files.
birthYear Year player was born
birthMonth Month player was born
birthDay Day player was born
birthCountry  Country where player was born
birthState   State where player was born
birthCity    City where player was born
deathYear    Year player died
deathMonth   Month player died
deathDay     Day player died
deathCountry Country where player died
deathState   State where player died
deathCity    City where player died
nameFirst    Player's first name
nameLast     Player's last name
nameGiven    Player's given name (typically first and middle)
weight       Player's weight in pounds
height       Player's height in inches
bats         a factor: Player's batting hand (left (L), right (R), or both (B))
throws       a factor: Player's throwing hand (left(L) or right(R))
debut        Date that player made first major league appearance
finalGame    Date that player made first major league appearance (blank if still active)
retroID      ID used by retrosheet, http://www.retrosheet.org/
birthDate    Player's birthdate, in as.Date format
deathDate    Player's deathdate, in as.Date format

Details

debut, finalGame were converted from character strings with as.Date.

### Parks table

**Description**

Name and location data for baseball stadiums.

**Usage**

data(Parks)

**Format**

A data frame with 255 observations on the following 6 variables.

- **park.key** unique identifier for each ballpark
- **park.name** the name of the ballpark
- **park.alias** a semicolon delimited list of other names for the ballpark if they exist
- **city** city where the ballpark is located
- **state** state where the ballpark is located
- **country** country where the ballpark is located

**Details**

This dataset apparently includes all ballparks that were ever used in baseball. There is no indication of the years they were used, nor the teams that played there.

The ballparks can be associated with teams through the park variable in the Teams table.

Examples

data(Parks)
library(dplyr)
# how many parks in each country?
table(Parks$country)

# how many parks in each US state?
Parks %>%
  filter(country=="US") %>%
  count(state, sort=TRUE)

# ballparks in NYC
Parks %>%
  filter(state=="NY") %>%
  filter(city %in% c("New York", "Brooklyn", "Queens"))

# ballparks in Canada
Parks %>%
  filter(country=="CA") %>%
  count(state, sort=TRUE)

# what are the Canadian parks?
Parks %>%
dplyr::filter(country=="CA")

People People table

Description
People table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the Batting, Pitching, and other files where players are identified only by playerID.

Usage
data(People)
**Format**

A data frame with 19878 observations on the following 26 variables.

- **playerID** A unique code assigned to each player. The playerID links the data in this file with records on players in the other files.
- **birthYear** Year player was born
- **birthMonth** Month player was born
- **birthDay** Day player was born
- **birthCountry** Country where player was born
- **birthState** State where player was born
- **birthCity** City where player was born
- **deathYear** Year player died
- **deathMonth** Month player died
- **deathDay** Day player died
- **deathCountry** Country where player died
- **deathState** State where player died
- **deathCity** City where player died
- **nameFirst** Player’s first name
- **nameLast** Player’s last name
- **nameGiven** Player’s given name (typically first and middle)
- **weight** Player’s weight in pounds
- **height** Player’s height in inches
- **bats** a factor: Player’s batting hand (left (L), right (R), or both (B))
- **throws** a factor: Player’s throwing hand (left(L) or right(R))
- **debut** Date that player made first major league appearance
- **finalGame** Date that player made first major league appearance (blank if still active)
- **retroID** ID used by retrosheet, [http://www.retrosheet.org/](http://www.retrosheet.org/)
- **birthDate** Player’s birthdate, in as.Date format
- **deathDate** Player’s deathdate, in as.Date format

**Details**

debut, finalGame were converted from character strings with as.Date.

**playerInfo**

 Lookup Information for Players and Teams

**Description**

These functions use grep to lookup information about players (from the People file) and teams (from the Teams file).

**Usage**

```r
playerInfo(playerID, nameFirst, nameLast, data = Lahman::People, extra = NULL, ...)
teamInfo(teamID, name, data = Lahman::Teams, extra = NULL, ...)
```

**Arguments**

- `playerID`: pattern for playerID
- `nameFirst`: pattern for first name
- `nameLast`: pattern for last name
- `data`: The name of the dataset to search
- `extra`: A character vector of other fields to include in the result
- `...`: other arguments passed to grep
- `teamID`: pattern for teamID
- `name`: pattern for team name

**Value**

Returns a data frame for unique matching rows from data

**Author(s)**

Michael Friendly

SeriesPost                  SeriesPost table

Description
Post season series information

Usage
data(SeriesPost)

Format
A data frame with 343 observations on the following 9 variables.

yearID  Year
round  Level of playoffs
teamIDwinner  Team ID of the team that won the series; a factor
lgIDwinner  League ID of the team that won the series; a factor with levels AL NL
teamIDloser  Team ID of the team that lost the series; a factor
lgIDloser  League ID of the team that lost the series; a factor with levels AL NL
wins  Wins by team that won the series
losses  Losses by team that won the series
ties  Tie games

Source

Examples

data(SeriesPost)

# How many times has each team won the World Series?

# Notes:
# - the SeriesPost table includes an identifier for the
# team (teamID), but not the franchise (e.g. the Brooklyn Dodgers
# [BRO] and Los Angeles Dodgers [LAN] are counted separately)
# - the World Series was first played in 1903, but the
# Lahman data tables have the final round of the earlier
# playoffs labelled "WS", so it is necessary to
# filter the SeriesPost table to exclude years prior to 1903.

# using the dplyr data manipulation package
library("dplyr")
library("tidyr")
library("ggplot2")

## WS winners, arranged in descending order of titles won
ws_winner_table <- SeriesPost %>%
  filter(yearID > "1902", round == "WS") %>%
  group_by(teamIDwinner) %>%
  summarise(wincount = n()) %>%
  arrange(desc(wincount))
ws_winner_table

## Expanded form of World Series team data in modern era

ws <- SeriesPost %>%
  filter(yearID >= 1903 & round == "WS") %>%
  select(-ties, -round) %>%
  mutate(lgIDloser = droplevels(lgIDloser),
         lgIDwinner = droplevels(lgIDwinner))
Bar chart of length of series (# games played)
1903, 1919 and 1921 had eight games
`ggplot(ws, aes(x = wins + losses)) + geom_bar(fill = "dodgerblue") + labs(x = "Number of games", y = "Frequency")`

Last year the Cubs appeared in the WS
`ws %>% filter(teamIDwinner == "CHN" | teamIDloser == "CHN") %>% summarise(max(yearID))`

Dot chart of number of WS appearances by teamID
`ws %>% gather(wl, team, teamIDwinner, teamIDloser) %>% count(team) %>% arrange(desc(n)) %>% ggplot(., aes(x = reorder(team, n), y = n)) + theme_bw() + geom_point(size = 3, color = "dodgerblue") + geom_segment(aes(xend = reorder(team, n), yend = 0), linetype = "dotted", color = "dodgerblue", size = 1) + labs(x = NULL, y = "Number of WS appearances") + scale_y_continuous(expand = c(0, 0), limits = c(0, 42)) + coord_flip() + theme(axis.text.y = element_text(size = rel(0.8)), axis.ticks.y = element_blank())`

Initial year of each round of championship series in modern era
`SeriesPost %>% filter(yearID >= 1903) %>% group_by(round) %>% summarise(first_year = min(yearID)) %>% arrange(first_year)`

Ditto, but with more information about each series played
`SeriesPost %>% filter(yearID >= 1903) %>% group_by(round) %>% arrange(yearID) %>% do(head(., 1)) %>% select(-lgIDwinner, -lgIDloser) %>% arrange(yearID, round)`

---

**Teams table**

**Description**

Yearly statistics and standings for teams
Usage
data(Teams)

Format
A data frame with 2925 observations on the following 48 variables.

yearID Year
lgID League; a factor with levels AA AL FL NL PL UA
teamID Team; a factor
franchID Franchise (links to TeamsFranchises table)
divID Team’s division; a factor with levels C E W
Rank Position in final standings
G Games played
Ghome Games played at home
W Wins
L Losses
DivWin Division Winner (Y or N)
WCWin Wild Card Winner (Y or N)
LgWin League Champion(Y or N)
WSWin World Series Winner (Y or N)
R Runs scored
AB At bats
H Hits by batters
X2B Doubles
X3B Triples
HR Homeruns by batters
BB Walks by batters
SO Strikeouts by batters
SB Stolen bases
CS Caught stealing
HBP Batters hit by pitch
SF Sacrifice flies
RA Opponents runs scored
ER Earned runs allowed
ERA Earned run average
CG Complete games
SHO Shutouts
SV Saves
IPouts  Outs Pitched (innings pitched x 3)
HA  Hits allowed
HRA  Homeruns allowed
BBA  Walks allowed
SOA  Strikeouts by pitchers
E  Errors
DP  Double Plays
FP  Fielding percentage
name  Team’s full name
park  Name of team’s home ballpark
attendance  Home attendance total
BPF  Three-year park factor for batters
PPF  Three-year park factor for pitchers
teamIDBR  Team ID used by Baseball Reference website
teamIDlahman45  Team ID used in Lahman database version 4.5
teamIDretro  Team ID used by Retrosheet

Details

Variables X2B and X3B are named 2B and 3B in the original database

  plot(motion2)
  #print(motion2, file="gvisTeamsSal.html")
}
```

## End(Not run)
**TeamsFranchises**

*TeamFranchises table*

**Description**

Information about team franchises

**Usage**

```r
data(TeamsFranchises)
```

**Format**

A data frame with 120 observations on the following 4 variables.

- **franchID**: Franchise ID; a factor
- **franchName**: Franchise name
- **active**: Whether team is currently active (Y or N)
- **NAassoc**: ID of National Association team franchise played as

**Source**

**Examples**

```r
data(TeamsFranchises)

# Which of the active Major League Baseball teams had a National Association predecessor?

# Notes:
# - the National Association was founded in 1871, and continued through the
# 1875 season. In 1876, six clubs from the National Association and two other
# independent clubs formed the National League, which exists to this day.
# - the 'active' field has "NA" for the National Association franchises
# - where appropriate, the 'NAassoc' field has the 'franchID' of the successor National League team

# using the dplyr data manipulation package
library("dplyr")

NatAssoc_active_table <- TeamsFranchises %>%
  filter(active == "Y") %>%
  filter(!is.na(NAassoc))

NatAssoc_active_table

# Merge current team IDs with franchise IDs
currentTeams <- Teams %>%
  filter(yearID == 2014) %>%
```
TeamsHalf

```r
# Merge TeamsFranchises with currentTeams
TeamsFranchises %>%
  filter(active == "Y") %>%
  select(-active, -NAassoc) %>%
  left_join(currentTeams, by = "franchID")
```

### TeamsHalf table

**Description**

Split season data for teams

**Usage**

```r
data(TeamsHalf)
```

**Format**

A data frame with 52 observations on the following 10 variables.

- **yearID** Year
- **lgID** League; a factor with levels AL NL
- **teamID** Team; a factor
- **Half** First or second half of season
- **divID** Division
- **DivWin** Won Division (Y or N)
- **Rank** Team’s position in standings for the half
- **G** Games played
- **W** Wins
- **L** Losses

**Source**

Examples

# 1981 season team data split into half seasons
data(TeamsHalf)
library("dplyr")

# List standings with winning percentages by
# season half, league and division
TeamsHalf %>%
  group_by(Half, lgID, divID) %>%
  mutate(WinPct = round(W/G, 3)) %>%
  arrange(Half, lgID, divID, Rank) %>%
  select(Half, lgID, divID, Rank, teamID, WinPct)
